Human adenovirus type 12.
Viruses; dsDNA viruses, no RNA stage; Adenoviridae; Mastadenovirus.
1 (bases 1 to 3498).
1 (bases 1 to 3498).
Nucleotide sequence of the right 10% of adenovirus type 12 DNA encoding the entire region E4.
Nucleotide sequence of the right 10% of adenovirus type 12 DNA encoding the entire region E4.
Nucleotide Acids Res 18 (10), 3065-3066 (1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /product="early E4 13 KD protein"

Canine adenovirus type 1.

Viruses: dsDNA viruses, no RNA stage; Adenoviridae; Mastadenovirus. 1 (bases 1 to 199).

Sira, S., Abouhaidar, M.G., Liu, Y.C. and Campbell, J.B.

Hollippe reiteration of a 40-bp nucleotide sequence in the inverted virology 159 (1), 76-83 (1987).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cantiforn 30288 bp DNA VRL 02-AUG-1996

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
Fercombinant adeno-associated virus contg. second gene which recombinant adeno-associated virus contg. second gene which acconversion from single stranded to double stranded virus - enhances efficiency of ex vivo transduction into target cell rampes - in the second sequence of a minigene containing the human adenovirus type 5 (Ad5) E4 region open reading frame (ORF) 6 under control of the mouse mammary tumour virus promoter and a growth hormone terminator sequence. The minigene is used to generate a packaging cell in expressing the E4 ORF6 product which is used to rescue and package on the deficient recombinant adeno-associated virus (rAAV). The rAAV comprises at least 2 selected genes, the first gene able to convert the single stranded virus to its double stranded form upon expression. The rAAV is useful in pharmaceutical compositions for use in ex vivo and the renet dysfunctions, e.g. cystic fibrosis.

PT Recombinant adeno-associated virus contg. second gene which recombinant adeno-associated virus stranded to double stranded to facilitates its conversion from single stranded to double stranded to transpare to the sequence of a second generation of recombinant of this is the nucleotide sequence of a second generation of recombinant cadeno-associated virus (rAAV) which contains 2 genes, the first gene of interest (beta-qabactosidase) in the target cell; and the second gene of interest (beta-qabactosidase) in the target cell; and the second gene of interest (beta-qabactosidase) in the target cell; and the storned gene of interest (beta-qabactosidase) in the target cell; and the storned virus to its double stranded form upon expression. The rAAV is stranded virus to its double stranded form upon expression. The rAAV is therefore the treatment of inherited diseases, cancer and other genetic convertions, e.g. cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3941

"T engineering in general

"T sequence is that of plasmid pAV. CMVALP.GRE-ORF6, also called

"A "orf6, which generates a recombinant adenovated virus

"C "A" orf6, which generates a recombinant adenovatives E4 ORF 6.

Adenoviral vectors - which lack DNA encoding for structural protein 'or fibre protein used particularly for gene therapy
Example 1; Pages 131-145; 170pp; English.
The present sequence is that of a pE4/Fibre plasmid used in the method of the invention. The plasmid contains an adenovirus type 5 (AD5) method of the invention. The plasmid contains an adenovirus type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The invention provides adenoviral vectors having deletions of all or part of

cally region proteins. Deletions in these proteins would allow a reduced risk of wild-type virus contamination and would also allow a reduced risk of foreign DNA in such vectors for a variety of diagnostic and therapeutic applications. The adenoviral vectors having deletions in complementation of these adenoviral genes. Therefore, the pE4/Fiber plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber and E4 gene region would be stably inserted into the host cell chromosomes. The resulting E4/fiber gene deficient plasmid can be used as a gene delivery vector. The gene deficient plasmid can be used as a gene delivery vector. The conditions characterised by hyper-proliferative cells (e.g. tumours), conditions characterised by hyper-proliferative cells (e.g. tumours), sickle cell diseases (e.g. Huntington's disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. HIV infection). Now ademoviral recombinant plasmid(s) - comprise sequences provided for expression of large foreign DNA fragments, used for, e.g. gene for expression of large foreign DNA fragments, used for, e.g. gene therefore the sequence comprises plasmid pBHGII that consists of This nucleotide sequence comprises plasmid pBHGII that consists of an EI-deleted ademovirus (Ad) genome. It contains a deletion of an EI-deleted ademovirus (Ad) genome. It contains a deletion of an EI-deleted ademovirus (Ad) genome. It contains a deletion of AdS (see also v07258) from bp 188-1339 (J.5-3, mu.). This CC AdS (see also v07258) from bp 188-1339 (J.5-3, mu.). This are perfectly contains a large deletion within the E3 region (bp BHGII also contains a large deletion within the E3 region (bp Exception removes the pascal fall and pBHGII deleted (Act E1 and CC PROMOTION PARTICLE). And pBHGII deleted (Act E1 and CC PROMOTION PARTICLE), and pBHGII (deleted for E1, polymerase as pBHGII deleted for E1, polymerase as pHGII on protice improved adenoviral vectors and packaging contains protein functions), are specifically claimed. The preterminal protein functions, and pARBGII deleted for E1, polymerase as the protein functions, are specifically claimed. The preterminal protein functions of the adenoviral vectors and packaging coll nettype of improved vector comprises deletions within the E3D region of the adenoviral genome (see also v07261).

These E3D-deleted virus are used in conjunction with novel cell inset that constitutively express E3D gene products. The invention of the adenoviral products of large genes (e.g. up to constitution provided adenoviral become and gutted vectors gene to the muscle of mice. The E3D-deleted and gutted vectors gene to the muscle of mice. The E2D-deleted and gutted vectors expensive the provided purpoved adenoviral vectors useful for a wide vectors of the packaging permit the E3D-deleted and gutted vectors of the packaging permit the packaging permit the E3D-deleted and gutted vectors of the packa

the Ela and E3 regions and comprise a single packaging signal sequence and E1 and E3 regions and comprise a single packaging signal sequence and E1 and E1 and Comprise a single packaging signal sequence. The E1 deletion contains at least one Paci Clai, xbal or BstBl cleavage site. The replication deficient viral vectors can be molecules of therapeutic importance, including isoforms of the nitric contains chloride channel (CFTR) gene, the dystrophin gene, the LD receptor gene and the erythropoiethin gene. The NOS isoforms can be used in vascular applications or in cancer therapy (microphage NOS), the LD receptor gene and the erythropoiethin gene. The NOS isoforms can be used in vascular applications or in cancer therapy (microphage NOS). The coronary artery bypass grafts. A NOS containing adenovirus can also be the contained or strain and to treat second contains and to treat second contains and the erythropoieth gene can be introduced into vein grafts prior to their use as coronary artery bypass grafts. A NOS containing adenovirus can also be the contained to a strain and the erythropoieth gene can be seed following coronary arteries.

Sequence 34382 BP; 7923 A; 9880 C; 9421 G; 7158 T; replication deficient adenoviruses having deletions of 8888888888888888888888

PT MOST cell chromatin in the presence of transposase, providing stable by the durable transgene expression

PS MATC cell chromatin in the presence of transposase, providing stable and durable transgene expression

PS Example 2; Fig 8A-1; 74pp; English.

CC This is the DNA sequence of the cis-acting recombinant adenovirus

CC This is the DNA sequence of the cis-acting demovirus (see 150.254) and Ad5417001. A trans-acting adenovirus (see 160.554) and Ad5417001. A trans-acting adenovirus (see 160.554) and Ad5417001. A trans-acting adenovirus (see 160.554) and Ad5417001. A trans-acting integration integration of the cis-acting terminal recombinant replication defective viruses (a) naw of, or corresponding to, at least part of the virus es. Claimed novel recombinant replication defective viruses (b) comprise: (a) DNA of, or corresponding to, at least part of the cis-acting terminal repeat sequences of a transposon, and ESI expression sequence (ESI) comprising a human gene (I) linked to the cis-acting terminal repeat sequences of a transposon, and ESI express (I) and transfer it to the cellular chromatin in vivo or in crombinant replication defective virus (B) containing a trans-acting a second expression sequence (ESI) compaining (a) as above and a second expression sequence (ESI) containing a trans-acting crombinant replication defective virus (B) containing a trans-acting and a second expression sequence (ESI) containing a trans-acting containing a trans-acting and able to express transposase in mammalian cells which stably express (I) integrated into its of or delivery and stable integration of (I) into a host cell cell-defects and able integration of (I) into a host cell cell-defects and action contains which stably express (I) integrated into its combinant retroviruses (RW) (claimed). Because (I) becomes repeated administration is avoided. The transgene is inherited by the combinant retroviruses (RW) (claimed).

Co progeny cells and the viral component is gradually degrated of comparing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The adenoviral recombinant plasmid(s) - comprise sequences provided and adenoviral recombinant plasmid(s) - comprise sequences provided are therapy of genetic disease(s).

The above and a sequence comprises the adenovirus 5 (Ad5) genome. The invention provides improved adenoviral vectors and packaging within the E2b region of the adenoviral genome (see also VO726). These E2b-deleted virus are used in conjunction with novel cell inters that constitutively express E2b gene products. The invention for also provides vectors deleted for all viral coding regions. These is sho to cells, as demonstrated by the transfer of the dystrophin provides improved adenoviral vectors useful for a wide variety of gene to the muscle of mice. The E2b-deleted and gutted vectors gene to the muscle of mice and sectors useful for a wide variety of sequence 35935 BP; 8367 A; 10074 C; 9760 G; 7734 T; 30-APR-1998.

nost cell orrowatin in the presence of transposory processing and durable transgene expression

Example 2; Fig 9A-1; 74pp; English.

Example 2; Fig 9A-1; 74pp; English.

Example 2; Fig 9A-1; 74pp; English.

His is the DNA sequence of the trans-acting recombinant adenovirus (see Fig. 0200Mygag-pol. It was obtained by co-transfecting HEK293 and AdSI/001.

A cis-acting demonstrated in linearised plasmid paddWygag-pol (see Fig. 0200Mygag-pol.)

Calso produced, and retrotransposition and integration into host calso produced, and retrotransposition and integration into host cells was demonstrated in HeLa cells infected with both viruses.

CC laimed novel recombinant replication defective viruses (a) the comprises (b) DNA of or corresponding to, at least part of the comprises (b) DNA of or infect a mammalian cell; and (b) a first comprises of expression sequences for expression, with the cassette flanked by crequisers for expression, with the cassette flanked by required for an infect a mammalian cell and can can express (l) and transfer it to the cellular chromatin in vivo or in cerombinant replication defective virus (b) containing a trans-acting crecombinant and each of expression sequence (ES) containing a trans-acting containing a because (ii) plus regulatory sequences, flanked by bNA of containing a condition with the action of the caperated of the capera transposase (ii) integrated into its of containing a trans-acting containing a trans-acting for containing a trans-acting containing a transposase gene (ii) plus regulatory sequences, flanked by bNA of containing a transposase gene (ii) plus regulatory sequences, flanked by and (a) are used conformatin, produced by infection with (A). (A) and (B) are used conformatin, produced with conventional adenoviral vectors and the need for repeated administratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
